

**Phased Plot: 560 Delila**

## Summary

Assumptions .....	2
Organ Mesa Observatory collaboration request.....	2
Initial data.....	2
Analysis .....	18
Conclusion .....	27

## Assumptions

Discovered 13/03/1905 at Heidelberg observatory by Max Wolf

Semi-major axis: 2.7518UA

Orbital eccentricity: 0.1598

Orbital inclination: 8.4673°

Diameter 37.2 Km

## Organ Mesa Observatory collaboration request

On November 2013 we received request from Mr. Frederick Pilcher (Organ Mesa Observatory) about observation on this minor planet. Preliminary observations have arose a period near to 30 hours and amplitude 0.15 Mag. For a complete curve coverage he needed help from observer with different longitude. We was pleased to have this collaboration and we took 16 sessions between November 6<sup>th</sup> and December 7th. No previous period is available.

## Initial data

Analysis was done taking measurement taken between 27/10/2013 and 04/12/2013.

Magnitude was converted in R using CMC14 catalog, VizieR Service on web site and the formula:  $R=r'\text{mag}-0.22$

Observations cover 38 days span.

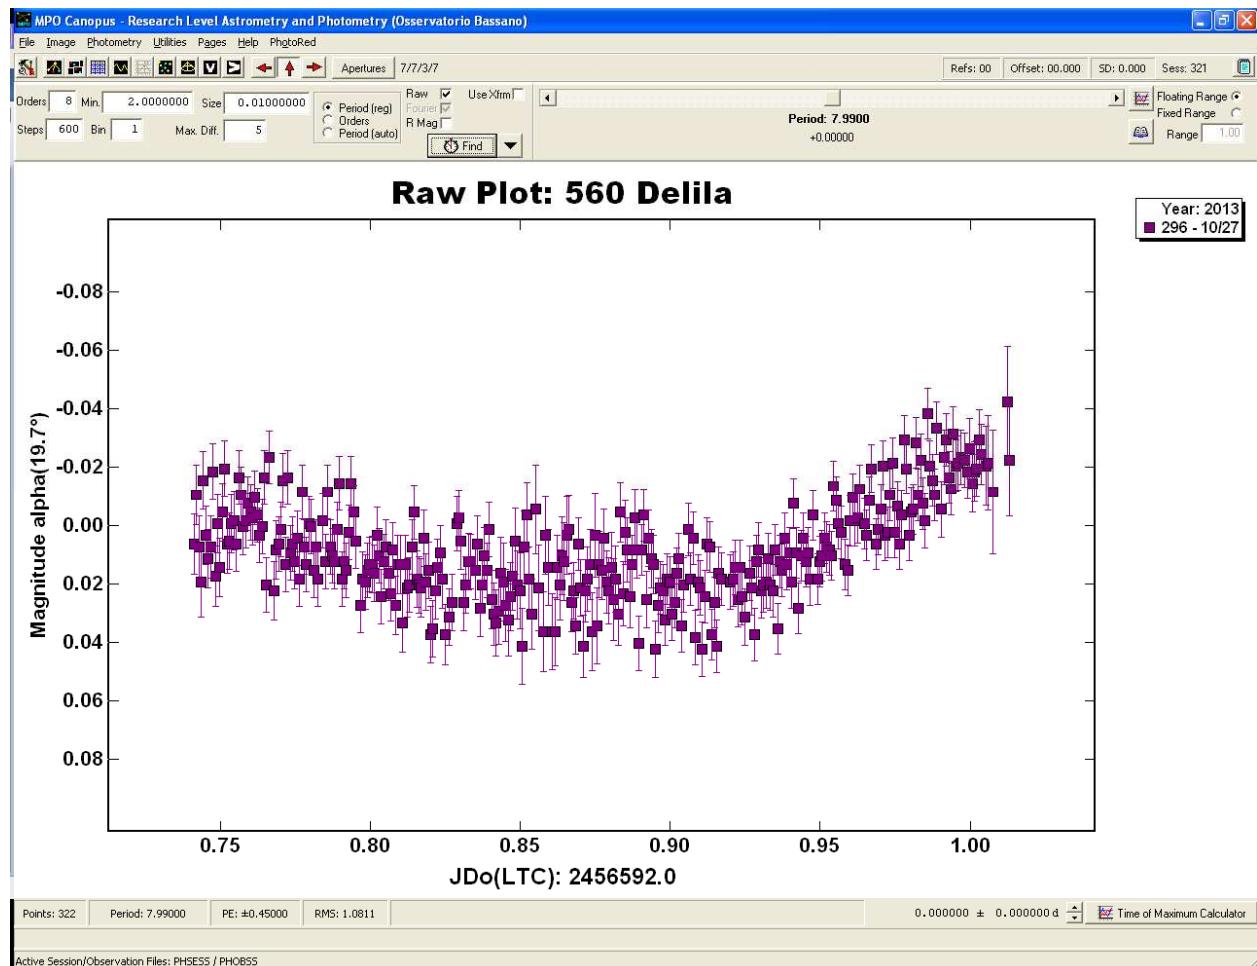

These sessions was included

## Analysis

A first check was done with all raw values.

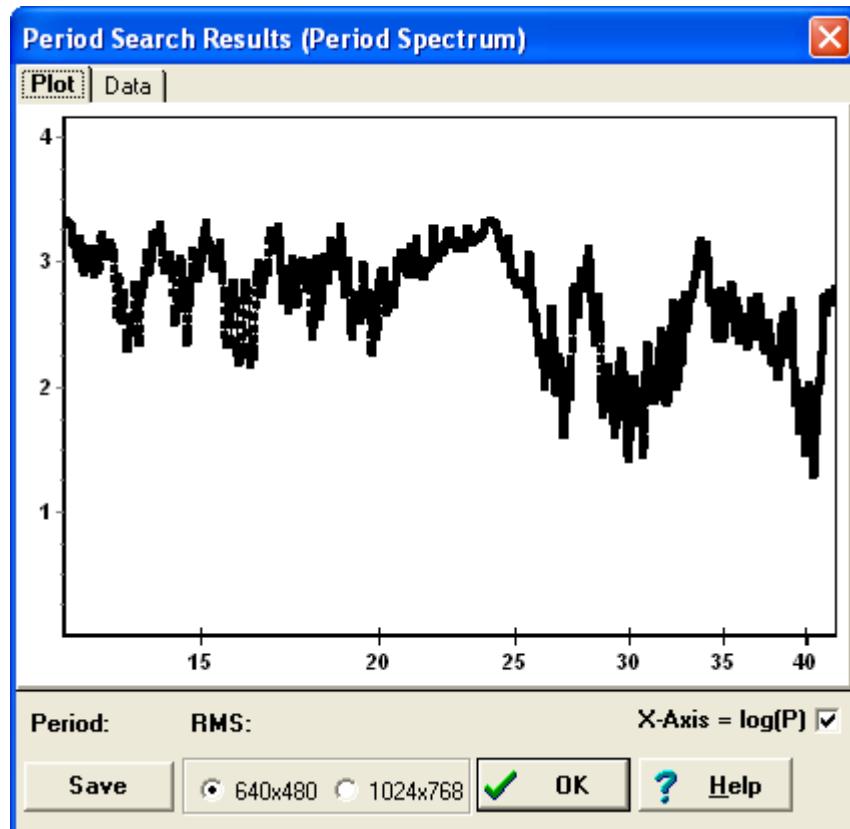

Amplitude is very low and there is a systematic shift up on Bassano Bresciano magnitudes compared with Organ Mesa ones. This can compromise the period search.

In a preliminary stage only Organ Mesa sessions was used. From these sessions 313 was excluded because it seems too shifted up.

Longest session don't show only a part of period so it should be greater than 12 hours  
A first analysis was done in the range between 12 and 42 hours with step 0.01.  
This is period spectrum.

It shows possible rotation time at: 27.0, 30.0, 40.5 hours

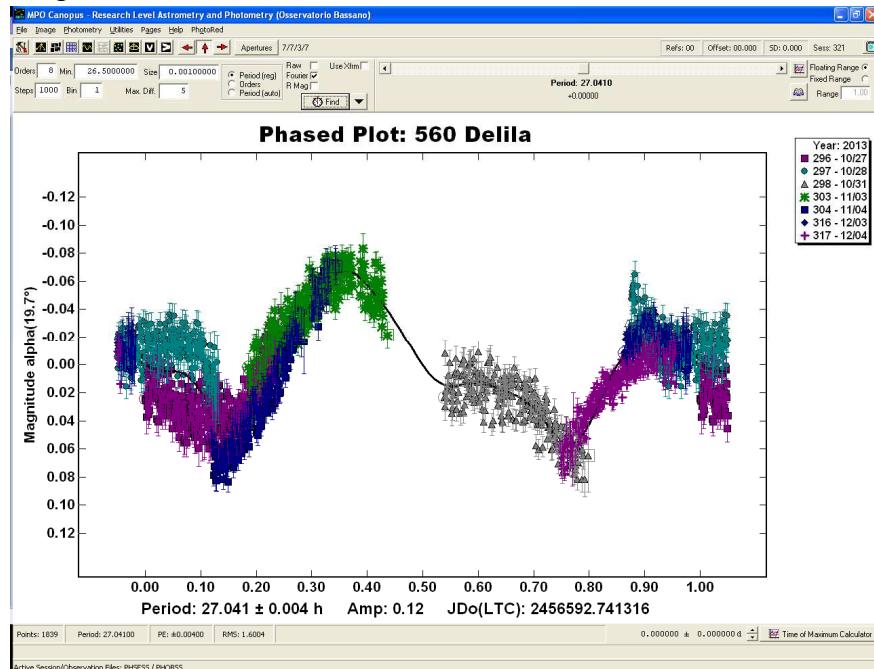

# Osservatorio di Bassano Bresciano

Jan 2014

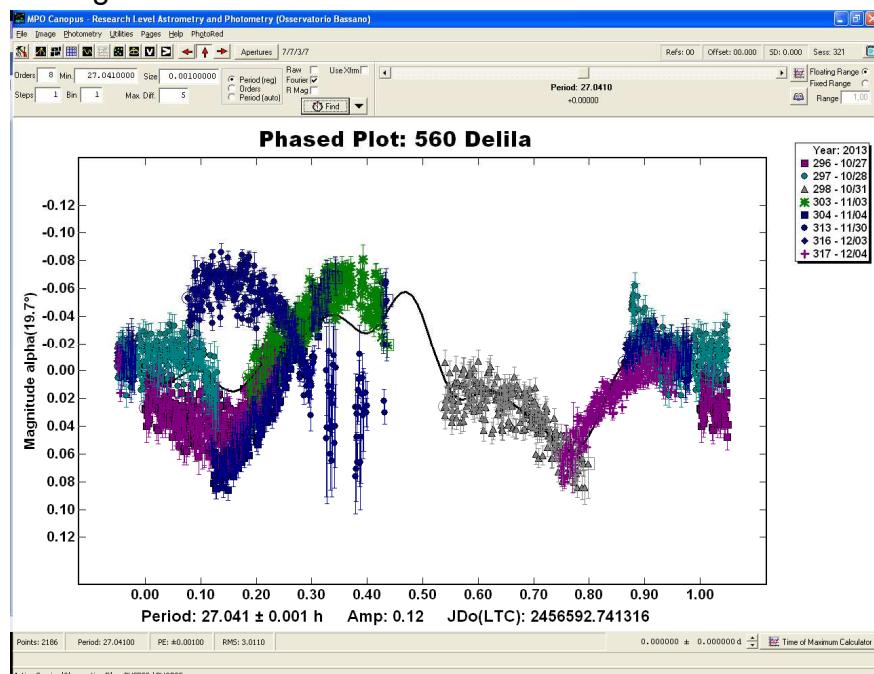

560 Delila rotation time find out

Pag.20

An analysis in the range between 26.5 and 27.5 hours with step 0.001 shows this phase diagram.

Adding session 313

No correlation

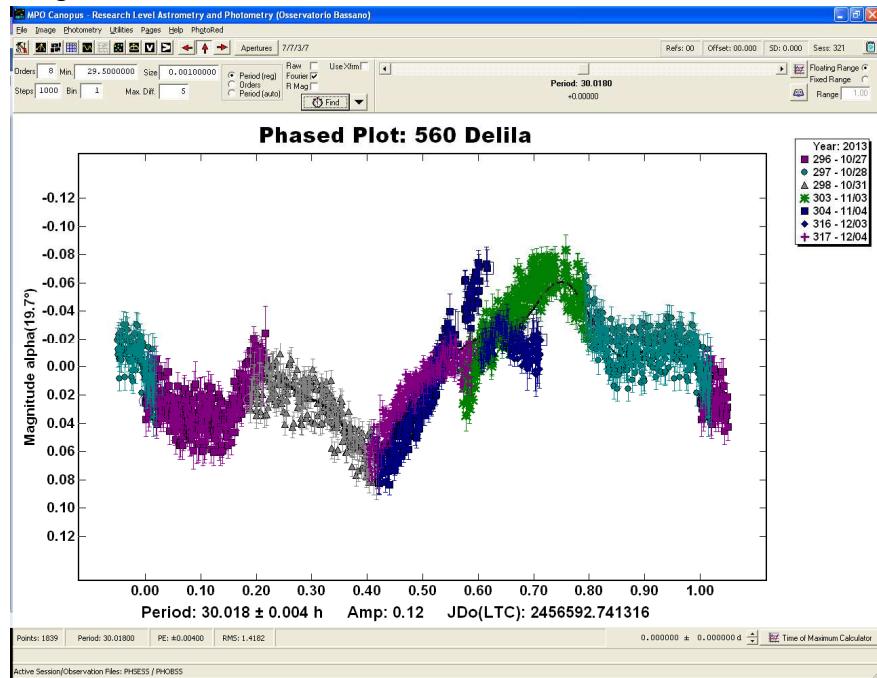

# Osservatorio di Bassano Bresciano

Jan 2014

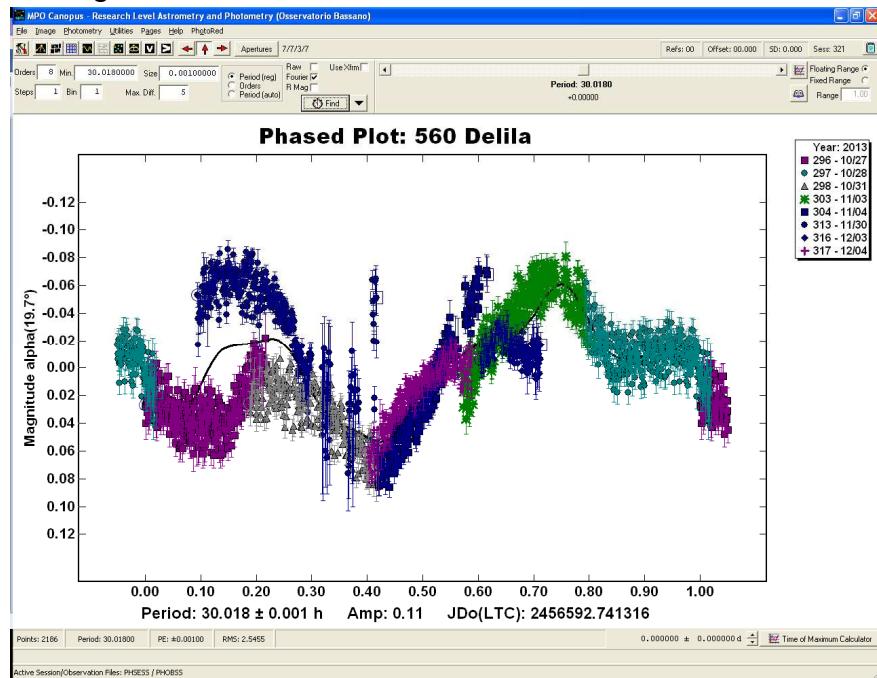

560 Delila rotation time find out

Pag.21

An analysis in the range between 29.5 and 30.5 hours with step 0.001 shows this phase diagram.

Adding session 313

Correlation seems be possibile appying a shift down to session 313

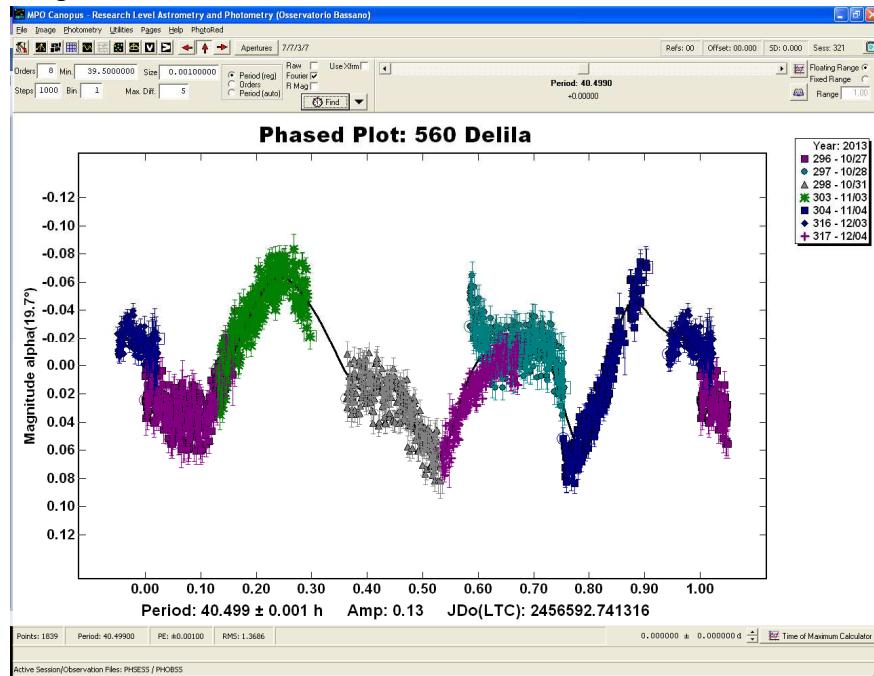

# Osservatorio di Bassano Bresciano

Jan 2014

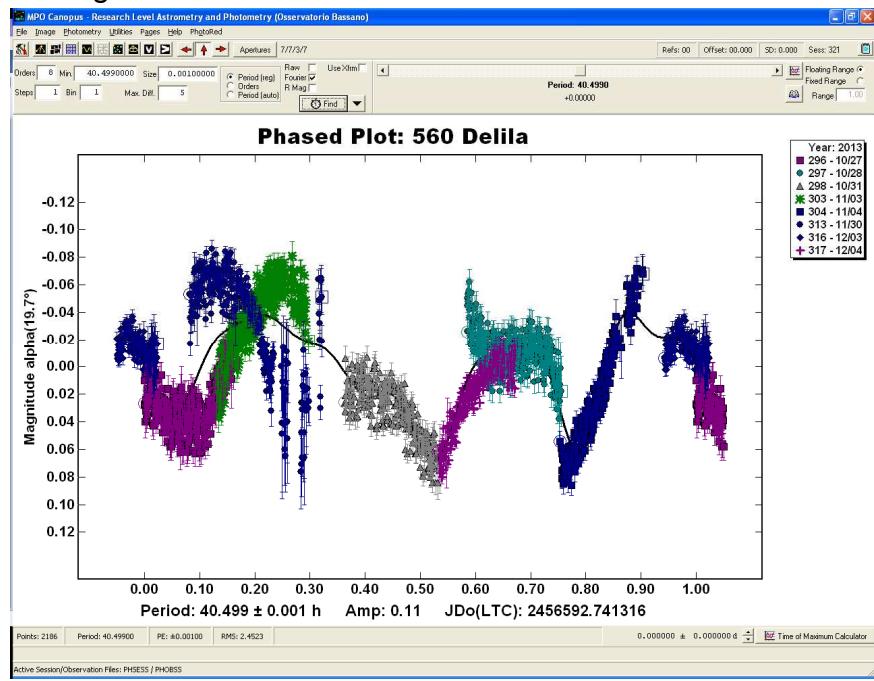

560 Delila rotation time find out

Pag.22

An analysis in the range between 39.5 and 40.5 hours with step 0.001 shows this phase diagram.

Adding session 313

Three maximum lightcurve

# Osservatorio di Bassano Bresciano

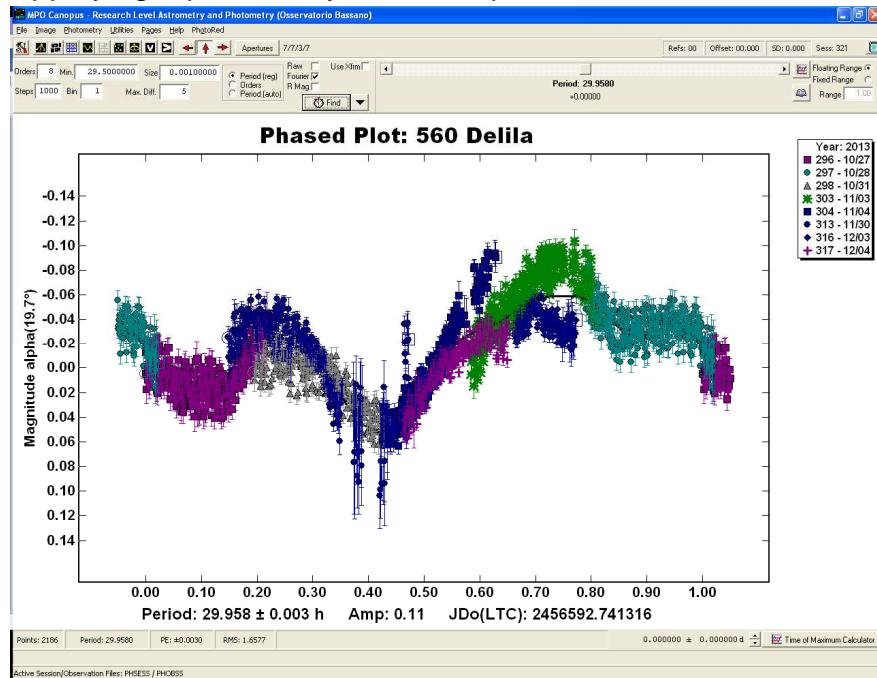

Jan 2014

560 Delila rotation time find out

Pag.23

The only possible period is near 30 hours.

Applying a preliminary delta comp. 0.050 to session 313

# Osservatorio di Bassano Bresciano

Jan 2014

560 Delila rotation time find out

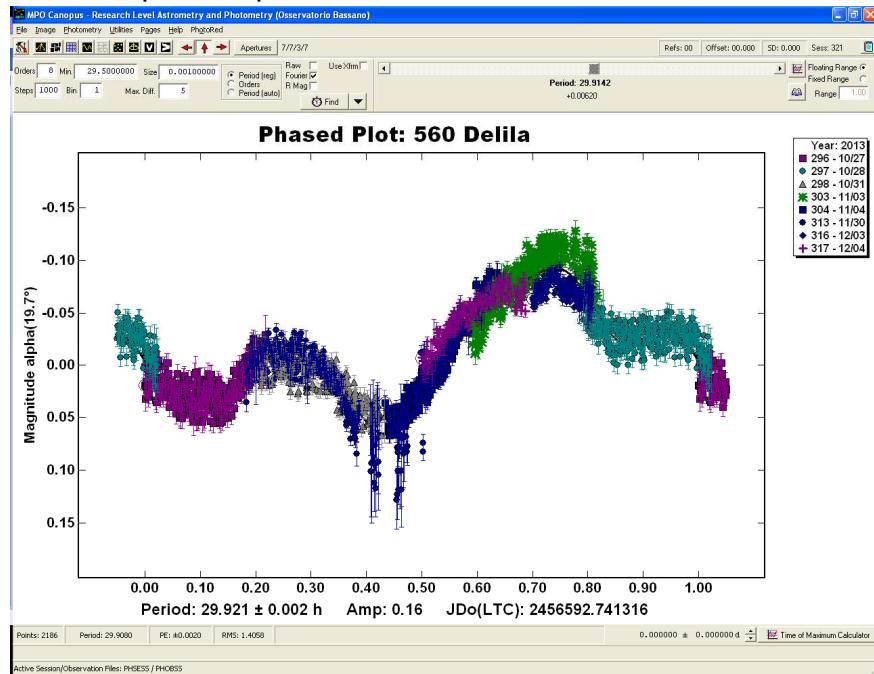

Pag.24

After that we adjusted delta comps roughly. These was set assuming as reference the session 304. Others sessions was adjusted running many time period finding trying different delta comp. values until RMS decrease. These was done for all sessions. Each time was found a value minimizing RMS the operation was replied on all other sessions. Process was stopped when any change in any session would make RMS greater.

At the end delta comp sessions is

296	0.010
297	0.000
298	0.000
303	-0.030
304	0.000
313	0.070
316	-0.040
317	-0.050

With this phased plot.

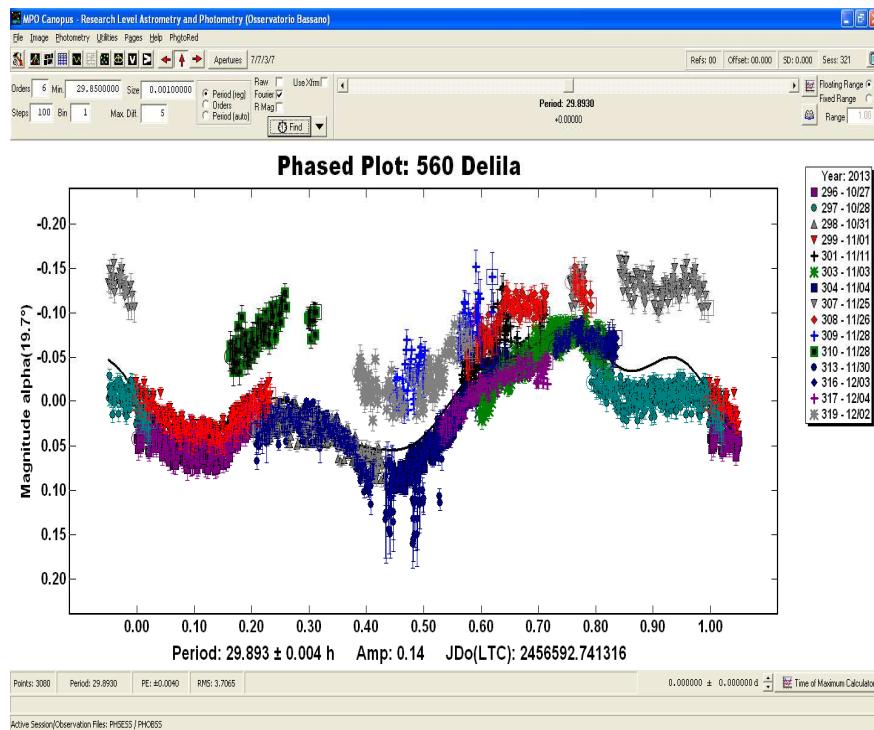

Including sessions from Bassano Bresciano observatory

# Osservatorio di Bassano Bresciano

Jan 2014

560 Delila rotation time find out

Pag.25

It is a very good correlation even if Bassano Bresciano sessions are shifted up round about 0.010 mag. This enforce the period = 29.92 hours

After that we adjusted delta comps strongly. These was set assuming as reference the session 304. Others sessions was adjusted running many time period finding trying different delta comp. values until RMS decrease. These was done for all sessions. Each time was found a value minimizing RMS the operation was replied on all other sessions. Process was stopped when any change in any session would make RMS greater.

At the end delta comp sessions is

296	0.000
297	-0.030
298	-0.010
299	0.020
301	0.040
303	-0.020
304	0.000
307	0.090
308	0.070
309	0.100
310	0.100
313	0.060
316	-0.060

With this phased plot.

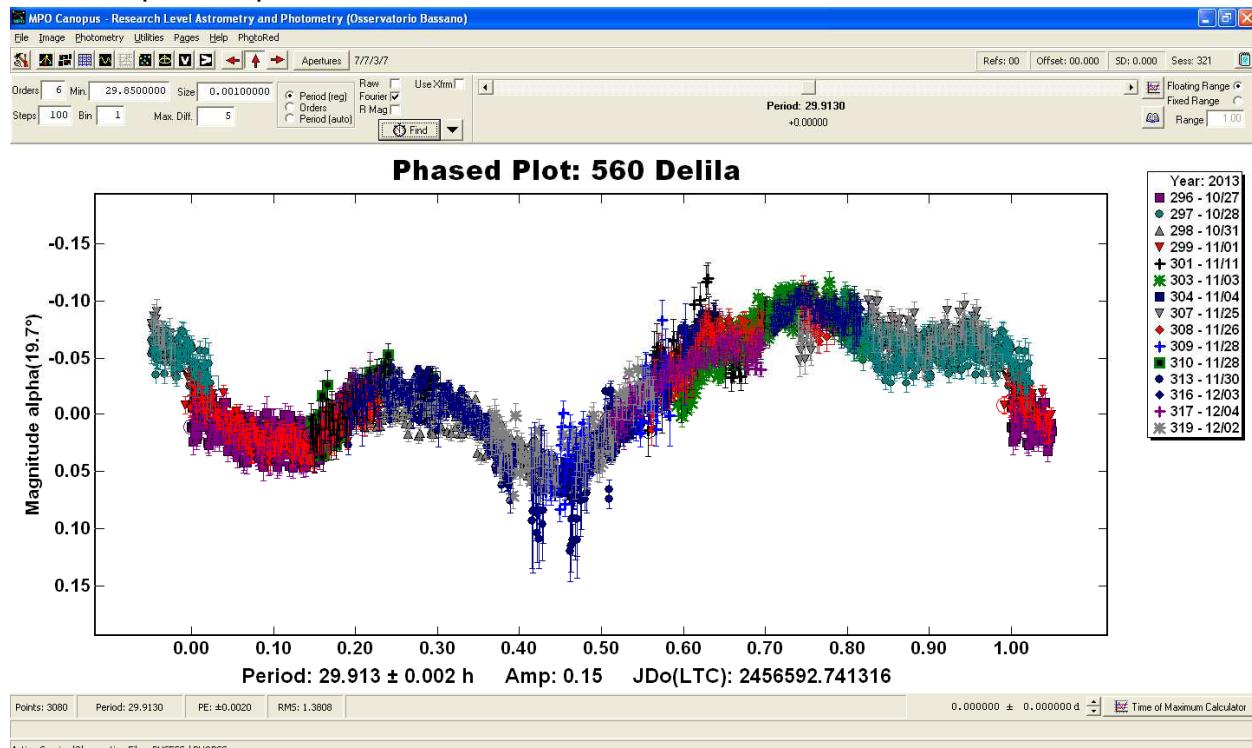

Diagram shows a period 29.913 hours and amplitude 0.15 Mag.

## Conclusion

Thank to Mr Frederick Pilcher for our involvement on this collaborative measurement.

Lightcurve coverage is full. Organ Mesa and Bassano Bresciano measurement agree with a very good confidence level with period 29.913 hours and amplitude 0.15 Mag.
